

Welcome

REDUCING CHOICE OVERLOAD IN amazon

Team – 6

Shahithya JC, Sneha Vohra, Ayesha, Siddharth

Initial Problem Statement:

Users experience decision fatigue on Amazon due to *overwhelming product choices, repetitive listings, and unclear information*, leading to confusion, reduced trust, and abandoned purchases.

amazon

5 Why's

2

Why are products so hard to compare?

Because listings are flooded with duplicates and white-labeled items using vague labels like "120+ sports mode" or "limited edition."

3

Why does Amazon allow this clutter and confusion?

Because the open marketplace permits near-identical listings, and review farming and fake reviews weaken trust.

4

Why isn't the platform filtering or curating better?

Because its algorithm prioritizes ads and volume, and it lacks personalized filters to narrow down meaningful options.

1

Why do users face decision fatigue?

Because they're overwhelmed by too many visually similar choices with minimal differentiation.

5

Why isn't decision-making easier for users?

Because the UI/UX lacks decision-support tools like side-by-side comparisons, trustworthy filters, and clearer feature tags.

Core Problem:

The core problem is that Amazon's marketplace *prioritizes volume and revenue over user experience, leading to a cluttered and overwhelming product selection.* This lack of curation and meaningful differentiation, combined with vague listings and ineffective personalised filtering systems, results in *decision fatigue for users.* The platform fails to support users in making informed choices, leaving them to navigate a complex and disorganized interface.

amazon

First Principle Thinking

Problem because of which customer suffers

Overwhelming Choices

More choices =
more confusion +
mental effort

Trust Issues

Related to reviews
and ratings and
biased sponsering

Irrelevant Ads/ Forced Upselling

Too many unnecessary
ads not related,
hampering the buying exp

Information Overload

Text heavy headings,
unexplained jargons,
no comparison tool

No Refined Personalisation

Not related to actual
needs or personalised

Second Order Thinking

Reducing the Number of Options (Curated Listings or Best Picks)

First-Order Effect:

- Users are presented with fewer but more relevant product options.
- This speeds up decision-making by simplifying choices.

Second-Order Effects:

- Helps reduce decision fatigue by eliminating overwhelming options.
- However, users might feel limited if their preferred products aren't shown.
- Could lead users to explore competitors for more variety.
- Emerging or lesser-known brands may struggle to gain visibility.

Improving Trust in Reviews, Ratings & Sponsored Listings

First-Order Effects:

- Verified purchase badges and AI-detected fake review filters increase credibility.
- Clear labeling of sponsored content improves transparency.
- Users rely more confidently on ratings and reviews for decision-making.

Second-Order Effects:

- Builds long-term user trust and loyalty to the platform.
- Encourages genuine reviews and discourages manipulative tactics.
- May reduce visibility for newer products or small sellers without many reviews.
- Over-policing could unintentionally filter out authentic but atypical reviews.

Second Order Thinking

More Refined Personalization Through AI

First-Order Effects:

- Users see more relevant products based on their behavior, preferences, and context.
- Increases engagement and likelihood of conversion.
- Reduces time spent searching or browsing irrelevant items.

Second-Order Effects:

- Enhances user satisfaction through a more tailored experience.
- Risks creating filter bubbles—users may miss out on exploring new or diverse products.
- Over-personalization might feel invasive if not transparent or controllable.
- Smaller brands or new launches may receive less exposure due to algorithmic bias.

Smart Comparison Tools (Side-by-Side Product Analysis)

First-Order Effect:

- Enables users to easily compare product features side by side.
- Supports faster, more informed decision-making.

Second-Order Effects:

- Reduces hesitation, making the purchase journey smoother.
- Highlights key differences that matter to users, boosting confidence in their choice.

Jobs To Be Done

I want to quickly identify the best options based on my needs and budget, so that I can make a confident and informed purchase without wasting time

Needs:

- **Functional:** Identify relevant, high-quality products quickly using filters and rankings.
- **Emotional:** Feel in control and efficient while making a decision.
- **Social:** Appear smart and decisive to others when choosing products.

I want to feel assured that I'm not making the wrong choice or missing a better deal, so that I can avoid regret or second-guessing after the purchase

Needs:

- **Functional:** Compare top-rated deals and alternatives with clarity.
- **Emotional:** Avoid anxiety and second-guessing after buying.
- **Social:** Protect reputation by consistently making "good" purchase choices.

I want to feel proud to recommend it or gift it, knowing it's reliable and well-reviewed, so that I can maintain credibility among friends or family

Needs:

- **Functional:** Find trustworthy products with strong reviews and reliability indicators.
- **Emotional:** Feel proud and secure gifting or recommending.
- **Social:** Reinforce credibility and taste among peers and family.

When I return to continue shopping, I want to resume with the same progress from where I left off, so that I don't have to restart my entire search process.

Needs:

- **Functional:** Retain filters, sort preferences, and saved comparisons between sessions.
- **Emotional:** Feel relaxed and focused by not having to repeat steps.
- **Social:** Appear organized and thoughtful in purchasing habits.

Opportunity Solution Tree

DOUBLE DIAMOND FRAMEWORK

Discover Stage

- Users feel overwhelmed by lookalike products with unclear differences.
- Listings are hard to evaluate due to vague specs and duplicates.
- Trust is reduced by fake reviews and near-identical items.
- Personalization falls short as algorithms prioritize volume and ads.
- The interface lacks tools to support quick, confident decisions.

Define Stage

Amazon's marketplace emphasizes volume and revenue over user experience, leading to a cluttered, overwhelming product selection. Poor curation, vague listings, and weak personalization cause decision fatigue, forcing users to navigate a complex, disorganized interface without meaningful support.

Deliver Stage

MVP: AI-Powered Chatbot Assistant

- A conversational assistant embedded in Amazon's app/web to:
- Ask clarifying questions ("gift or personal?", "budget?", "brand preference?")
- Instantly narrow down top 1-3 product choices
- Offer quick pros/cons, ratings, and delivery confidence

Develop Stage

- Smart Filters auto-tuned to user behavior (e.g. "reliable gifts", "best value-for-money").
- AI Powered Chatbot Assistant - A conversational interface embedded in the Amazon app/site .
- 1-Click Curated Picks from verified influencers or past purchase success.
- Fast Decision Mode" interface - compare top 3 in a simple card view.

Case Study Analysis

CASE STUDY ANALYSIS – FLIPKART

Studying User Behavior

Amazon users searching for popular categories (e.g., electronics, grooming devices) often face:

- Thousands of near-identical listings.
- Multiple sellers with similar titles.
- Repetitive ad-prioritized suggestions.

This results in:

- Endless scrolling and tab comparisons.
- Reliance on YouTube reviews.
- Drop-offs due to decision fatigue.

Flipkart users, by contrast, experience:

- Fewer, more curated results.
- Better product categorization.
- Built-in comparison tools and trust badges like “Flipkart Assured

Pain Points on Amazon

- Cognitive Overload: Too many similar options with minimal differences.
- Trust Deficit: Fake reviews and over-optimized listings hurt credibility.
- No Guided Discovery: Lacks tools to help users evaluate easily.
- Repetitive Experience: Doesn’t support resuming previous searches.
- Poor Personalization: Feels driven by ads, not user intent.

Impact on User Experience

- Higher Drop-offs: Users often leave after prolonged browsing.
- Lower Conversions: Many switch to other platforms or offline buying.
- Decision Paralysis: Too many similar options delay choices.
- Reduced Loyalty: Amazon feels like a research-heavy, tiring process.

Inspiration from Flipkart

- Flipkart Assured: Builds instant trust.
- Curated Filters: E.g., “Top Rated by Gamers”, “Best Under ₹2000”.
- Smart Comparisons: Simplified specs & color-coded highlights.
- Auto-Save Sessions: Encourages users to continue where they left off.

Expected Impact on Amazon

- Higher Confidence: Smart comparisons and AI summaries guide quicker choices.
- Lower Drop-offs: Session recall and better filters keep users engaged.
- Faster Decisions: Clear specs and curated lists speed up buying.
- Stronger Loyalty: Smoother experience builds trust and retention.
- Improved Trust: Fewer duplicates and verified info rebuild credibility.

Solutions

✓ **Solution 1: AI Chatbot for Personalized Recommendations**

Goal:

Help users make quicker, more confident purchase decisions through personalized guidance — similar to a digital shopping assistant.

🧠 Detailed Concept:

Amazon's app already provides extensive filters, but many users still get overwhelmed with options. A chatbot (embedded in the interface, not intrusive) can act as a guided shopping assistant. It initiates a short conversation asking:

- "What are you looking for today?" (e.g., laptop, running shoes?)
- "What's your budget?"
- "Any specific brands you prefer or want to avoid?"
- "What will you mostly use this for?"

Based on the responses, it fetches a curated list of 5–7 products—not the full catalog. These products are shown in a simplified card layout with summary highlights like price, rating, and key feature tags (e.g., "best for multitasking", "great battery life"). The chatbot may also explain why it picked certain items ("Because you prefer budget-friendly options under \$600 with good battery life").

Solutions

✓ Solution 2: Improved Review System

🎯 Goal:

Combat review farming and help users read only reviews that matter to them.

🧠 Detailed Concept:

Currently, Amazon reviews often surface vague, repetitive, or farmed reviews that don't actually help real customers decide. This feature redesigns the review section to:

- Prioritize reviews from users with similar purchase behavior or preferences.
- Tag reviews as: "Similar to your buying pattern", "Verified user after 6 months of use", "Frequent Amazon reviewer", "Trusted review (AI verified)"
- Provide review filters: e.g., "Long-term reviews", "Same budget range", "Same location", "Mentioned durability"
- Collapse generic or low-trust reviews by default but allow users to expand them.

This makes review browsing far more efficient and personalized.

Solutions

✓ Solution 3: Smart Comparison Tool with Trusted AI Summary

Goal:

To ease choice overload by enabling clear side-by-side comparisons and offering a trusted AI summary of specs and reviews—while letting users stay in control of their decision.

🧠 Detailed Concept:

In categories like electronics, kitchen appliances, or grooming products, users often face decision fatigue due to near-identical options. This solution introduces a built-in Smart Comparison Tool that lets users:

- Select 2–4 products for comparison
- View a side-by-side breakdown of key features like price, delivery, ratings, reviews, and brand warranty
- See pros and cons derived from verified customer reviews
- Receive a subtle AI-generated summary suggesting the best match based on:
 - Personal priorities (e.g., budget, brand, battery life)
 - Qualitative review sentiment, not just star ratings
 - Verified purchase reviews (weighted higher than general ones)
 - Return rates or product issues (if available internally)

Solutions

✓ **Solution 4:** Recent Searches with Applied Filters + Smart Resume Nudge

🎯 **Goal:**

To reduce user friction and decision fatigue by helping users easily resume previous shopping sessions with their filters and progress preserved — especially when they abandon a session mid-way due to choice overload or distraction.

🧠 **Detailed Concept:**

This feature creates a “smart memory” layer within the Amazon app that remembers what the user searched for, which filters they applied (e.g., brand, price, rating), and where they stopped scrolling in a long product list.

Example Scenario:

A user searches for "Bluetooth headphones under ₹3000," applies filters (Boat, 4★+, Prime), and browses 200+ products but doesn't purchase.

Two days later, they search "wireless headphones" again.

Instead of starting over, Amazon shows a subtle prompt: “You previously browsed this search. Continue from where you left off with the same filters?”

The user taps Continue, lands on product #201, and resumes browsing — saving time, effort, and reducing decision fatigue.

THE END

Thank you for your time and attention throughout this presentation. We hope the insights shared were valuable to you.
